16. Abstract

To assist in the understanding of weather product use by Air Traffic Control Specialists (ATCS) and Automated Flight Service Station (AFSS) Specialists, the Federal Aviation Administration (FAA) William J. Hughes Technical Center conducted a Limited Job Task Analysis (JTA) for select positions at an Automated Flight Service Station (AFSS) from January 10, 1994, to January 13, 1994, and an Air Route Traffic Control Center (ARTCC) from January 10, 1994, to January 18, 1994. Both facilities are located in Fort Worth, Texas. Among the positions evaluated were Preflight Specialists, Inflight Specialists, and Enroute Flight Advisory Service (EFAS) Specialists from the Ft. Worth AFSS and Traffic Management Coordinators (TMC) from the Ft. Worth ARTCC.

The JTA was developed in two stages. The first stage of the JTA was a research effort in which several reference documents were used to develop task lists and flowcharts for Flight Service Specialists and TMCs. The second stage of the JTA involved confirming the flowcharts and weather tables developed during the first stage. This was accomplished by comparing the flowcharts and weather tables to observed job tasks and weather information requirements of specialists and controllers at the Ft. Worth AFSS and the Ft. Worth ARTCC.

Although a few discrepancies were noted for the Inflight Specialists, the majority of the information in the flowcharts was confirmed during the observation session with Preflight and EFAS Specialists and TMCs. The discrepancies noted are discussed in detail along with issues relating to the user-system interface of weather systems and recommentations for new aviation weather products.

EXECUTIVE SUMMARY

To assist in the understanding of weather product use by Air Traffic Control Specialists (ATCS) and Automated Flight Service Station (AFSS) Specialists, the Federal Aviation Administration (FAA) William J. Hughes Technical Center conducted a Limited Job Task Analysis (JTA) for select positions at an Automated Flight Service Station (AFSS) from January 10, 1994, to January 13, 1994, and an Air Route Traffic Control Center (ARTCC) from January 10, 1994, to January 18, 1994. Both facilities are located in Fort Worth, Texas. Among the positions evaluated were Preflight Specialists, Inflight Specialists, and Enroute Flight Advisory Service (EFAS) Specialists from the Ft. Worth AFSS and Traffic Management Coordinators (TMC) from the Ft. Worth ARTCC. The intent of the JTA is to address how controllers and specialists access and use weather information and to identify issues regarding user interactions with current weather systems.

The JTA was developed in two stages. The first stage of the JTA was a research effort in which several reference documents (FAA 7210.3, FAA 7110.10, FAA 7110.65, Air Traffic Weather Needs and Requirements Report, and National Aviation Weather Program Plan) were used to develop task lists and flowcharts for Flight Service Specialists and TMCs. Tables were also developed listing required information for any task involving weather assessment or dissemination.

The second stage of the JTA involved confirming the flowcharts and weather tables developed during the first stage. This was accomplished by comparing the flowcharts and weather tables to observed job tasks and weather information requirements of specialists and controllers at the Ft. Worth AFSS and the Ft. Worth ARTCC.

Although a few discrepancies were noted for the Inflight Specialists, the majority of the information in the flowcharts was confirmed during the observation session with Preflight and EFAS Specialists and TMCs. The discrepancies noted are discussed in detail along with issues relating to the user-system interface of weather systems.

Based on the conclusions reached during this evaluation, several recommentations for new aviation weather products are suggested. Recommendations contained within this document should be utilized in the development of future systems and products.

1. INTRODUCTION.

The Federal Aviation Administration (FAA) William J. Hughes Technical Center is currently involved in several programs involving the creation, distribution and display of various aviation related weather products for use by Air Traffic (AT) Two recent reports, the AT Weather Needs and Requirements Report, October 1994, and the National Aviation Weather Program Plan, September 1992, address Air Traffic weather Both reports provide information regarding current aviation weather information requirements. In addition, the National Aviation Weather Program Plan outlines general recommendations for future systems. While these reports address the specific needs of air traffic controllers, they do not outline the process by which controllers and specialists access and use weather information. It is necessary to understand this process so that designers can provide products that more accurately and efficiently meet the demands of controller job tasks.

To assist in the understanding of weather product use by Air Traffic Control Specialists (ATCS) and Automated Flight Service Station (AFSS) Specialists, the FAA Technical Center conducted a Job Task Analysis (JTA) for select positions at the AFSS and an Air Route Traffic Control Center (ARTCC) in Fort Worth, Texas (ZFW). The intent of the JTA is to address how controllers and specialists access and use weather information.

1.1 PURPOSE.

The purpose of this report is to describe the results of the JTA. The report supplements the Air Traffic Weather Needs and Requirements Report and the National Aviation Weather Program Plan by describing how controllers and specialists use aviation weather information. The report outlines how specific weather information is obtained, why it is obtained, and the format of the weather information. Information for this report was collected by FAA Technical Center personnel as part of the FAA Aviation Weather Development Program (AWDP).

1.2 SCOPE.

This report addresses objectives, participants, methodology, results, and conclusions. Recommendations regarding the development of new weather systems are also made. The report is written using FAA-STD-024B as a guideline. Titles and sections were changed where appropriate. The report provides the results of the JTA effort and outlines the observed process of obtaining

required weather information. Information format and usability problems are also discussed.

The JTA is limited in that it outlines only top level job tasks and addresses only weather related tasks and information. It does not address other aviation specific information. Job task and weather requirements information are discussed for the following positions:

- a. AFSS Preflight Specialists;
- b. AFSS Inflight Specialists;
- c. AFSS Enroute Flight Advisory Service (EFAS) Specialists; and
- d. ARTCC Traffic Management Unit (TMU) Traffic Management Coordinators (TMC).

While FAA standards and documents were used to compile the JTA information, data was only confirmed at the Fort Worth AFSS and Fort Worth ARTCC. It is likely that some minor variations in operational tasks may exist at other facilities.

3. SYSTEM DESCRIPTION.

3.1 MISSION REVIEW.

According to the National Aviation Weather Program Plan, current aviation weather products do not fully address the needs of airspace users. User needs continue to surpass the capability of current weather products. Both the Air Traffic Weather Needs and Requirements Report and the National Aviation Weather Program Plan partially identify user needs for the future. Therefore, the mission of the JTA was to further assess these user needs by outlining how weather information is used. Understanding how users utilize weather information will assist in the development of new FAA National Airspace System (NAS) weather products.

3.2 SYSTEM CONFIGURATION.

This section describes the position and general responsibilities of AT personnel utilized throughout the development of the JTA.

3.2.1 AFSS Preflight Specialists.

Preflight specialists provide all necessary meteorological and aeronautical information required by a pilot in making preflight decisions and calculations. Preflight specialist duties and information disseminated include:

- a. Obtain current and forecast weather information for departure, enroute, and terminal locations;
- b. Provide locations of hazardous and severe weather and alternate routes;
- c. Provide routes of flight, preferred routes, aids to navigation, notices to airmen (NOTAMs), restricted areas, military training routes, special military operations, terminal information, mileage, and flight computation;
- d. Provide any other information deemed necessary by the pilot or specialist; and
 - e. Provide continued assessment and update of weather.

3.2.2 AFSS Inflight Specialists.

Inflight specialists' duties parallel preflight duties except that decisions and assistance given are more time critical

because the aircraft is airborne. Inflight specialist duties are:

- a. Provide emergency services to aircraft in distress;
- b. Obtain and disseminate pilot weather reports encountered during flight;
- c. Determine, during radio contact, pertinent information required by the pilot and furnish such information;
- d. Relay position reports, clearances, weather information, Air Traffic Control (ATC) messages, and flight plans between aircraft inflight and the appropriate control facility;
- e. Provide airport information service to landing and departing aircraft at non-towered airports;
 - f. Maintain radio guard for enroute aircraft;
- g. Initiate contact with aircraft to obtain position reports; and
 - h. Provide flight monitoring over hazardous areas.

3.2.3 AFSS Enroute Flight Advisory Service (EFAS) Specialists.

EFAS specialists provide enroute weather information to airborne aircraft in an assigned geographical area. Duties of EFAS specialists include:

- a. Provide in-depth knowledge of static (e.g., topography, frequencies) and dynamic information (e.g., airway structure, Navigational Aids [NAVAID], aeronautical information);
- b. Serve as focal point for consolidating reports of current enroute weather;
- c. Issue flight advisories interpolated to routes, altitudes, or alternates;
- d. Interpret and issue updates on trends in weather not specifically addressed in the forecast including thunderstorm and precipitation location;
- e. Interpret Geostationary Operational Environmental Satellite (GOES) data;

- f. Provide departure, enroute, and arrival services as required; and
 - q. Provide emergency assistance as necessary.

3.2.4 ARTCC TMU Traffic Management Coordinator (TMC).

ARTCC TMU TMCs are responsible for analyzing traffic flow and metering aircraft in the ARTCC's area of responsibility and providing data to controllers and pilots to operate safely and economically. Duties include:

- a. Develop and initiate flow control procedures as required between intracenter areas and between adjacent enroute facilities;
- b. Issue flow control restrictions to adjacent center and/or towers as necessary;
- c. Maintain a continuous awareness of the traffic flow, status of NAVAIDs, weather conditions, and traffic forecasts;
- d. Act as liaison between major terminals and adjacent centers;
- e. Operate the metering position in a timely manner to ensure maximum flow;
- f. Develop and maintain schedules for releasing aircraft in adjacent areas during flow control procedures;
- g. Ensure compliance with flow control requirements initiated by other facilities;
- h. Notify users of possible delays and maintain statistical records of these delays;
- i. Perform weather coordinator duties in a timely manner to ensure all users receive maximum benefit from weather information including Airmen Meteorological Information (AIRMET), Significant Meteorological Information (SIGMET), and Severe Weather Warnings;
- j. Inform area manager of all flow control procedures in effect:
 - k. Interact and coordinate with the Air Traffic Control System Command Center (ATCSCC) as necessary

3.3 INTERFACES.

This section describes AT systems examined as part of the JTA.

3.3.1 AFSS Systems.

In the Ft. Worth AFSS, as at most AFSSs, each Preflight, Inflight, and EFAS specialist has a Model 1 Full Capacity (M1FC) system and a private vendor graphic weather system at their position. Specialists use these systems to access weather information for dissemination. These systems are described below.

3.3.1.1 Model 1 Full Capacity (M1FC).

M1FC provides specialists with route-specific weather data. The M1FC utilizes a command line interface, in which the user inputs requests by entering a route, location, or weather report via a keyboard. Once the request is entered, the M1FC outputs information in a textual format. Depending upon the request entered, the output can vary in length from one line of information to several pages of information. M1FC weather data is used by all AFSS Specialists to provide pilots with weather briefings and enroute weather updates. Weather information obtained from the M1FC includes:

- a. Weather synopsis,
- b. Severe weather warnings,
- c. Areas weather hazards,
- d. Convective outlooks,
- e. Surface aviation observations,
- f. Terminal forecasts,
- g. Area forecasts,
- h. Winds aloft, and
- i. PIREPs.

Figures A-1 through A-10 as shown in appendix A illustrate these components of the M1FC output. As shown in figures A-1 through A-10, M1FC text output is abbreviated. Figure A-10 demonstrates the conversion of a severe weather warning from abbreviated text to standard text.

3.3.1.2 Vendor Weather Systems.

Graphical representation allows users to obtain a spatial and temporal picture of current and forecasted weather. A number of private vendors provide weather products to AFSSs in the United States. These weather products are provided using different weather systems in a graphical format. The typical vendor system requires input via a keypad in order to access the weather

information. Ft. Worth AFSS utilizes a Weather Services
International (WSI) weather system. WSI graphics require the
user to input a number for the desired screen. Kavouras, Inc.
also provides a graphic weather system. Kavouras, Inc. graphics
require the user to move through a hierarchical menu structure in
order to access weather information. Weather data obtained on
the graphic weather systems include:

- a. Surface and upper air analysis,
- b. Freezing level analysis,
- c. Stability index analysis,
- d. Radar depiction,
- e. Current weather depiction,
- f. Surface and upper air prognosis,
- g. Satellite imagery (GOES), and
- h. Maximum wind and windshear analysis/prognosis.

3.3.2 TMC Systems.

TMCs receive most of their weather information from the collocated Center Weather Service Unit (CWSU). The CWSU meteorologist has limited duty, usually between 6 a.m. and 10 p.m. During these hours, the CWSU provides the TMC with weather briefings and updates on a regular basis. In order to provide these briefings and updates, the CWSU utilizes several systems. These systems include the Meteorologist Weather Processor (MWP), a desktop computer that collects information from the NWS, Next Generation Radar (NEXRAD), the National Airspace System (NAS) Host system, and Leased Service A System (LSAS).

In addition to communication with the CWSU, TMCs directly receive weather information via the MWP briefing terminal, the Aircraft Situation Display (ASD), the NAS Host computer, and the Keyboard Video Terminal (KBVT). When the CWSU is off-duty, the TMC utilizes the MWP briefing terminal, ASD, and KBVT to obtain the necessary weather information. If the TMC has questions or concerns about weather information displayed, he/she can call the ATCSCC or the Weather Service Forecast Office (WSFO) for further meteorological assistance.

The following systems are utilized by CWSUs and/or TMCs to provide weather for the TMU.

3.3.2.1 Meteorologist Weather Processor (MWP).

The MWP provides the CWSU with numerous weather products. These weather products are designed for the meteorologist to provide information to the TMC. MWP briefing terminals are located at

the TMU and at area supervisor stations throughout the ARTCC. These briefing terminals are linked to the MWP weather system at the CWSU. The MWP briefing terminal presents graphical weather products to TMCs. Using the briefing terminal, TMCs can select and display any of the MWP graphic weather products. TMCs select products by toggling through a list. Once a set of products is selected, the TMC initiates a looping sequence in which the products are sequentially presented for 10-15 seconds. A looping sequence must be initiated in order for the products to be automatically updated. Weather products most often displayed on the MWP briefing terminal include:

- a. Radar (both national and regional scales);
- b. Cloud coverage (GOES imagery for national and regional scales);
 - c. Winds aloft; and
 - d. Jet stream.

3.3.2.2 Aircraft Situation Display (ASD).

The primary role of the ASD is to provide aircraft information to TMCs. However, the ASD also provides TMCs with cloud coverage information and lightning data. TMCs interface with the ASD via a mouse and menu system with an alternate method of using function keys.

3.3.2.3 NAS Host Computer.

The hosts mission is to provide information for ATC. CWSUs utilize this text based system to disseminate Pilot Reports (PIREPs) to TMCs and controllers.

3.3.2.4 Keyboard Video Terminal (KBVT).

The KBVT is a text-based system that is used to obtain Surface Aviation Observation (SAO) weather reports and other weather observations required by the TMC.

3.3.2.5 Desktop Computer.

Most CWSUs have a desktop computer with a dedicated communication line that receives weather information from the National Weather Service (NWS). The desktop computer collects and displays information regarding AIRMETS, SIGMETS, Convective SIGMETS, and Severe Weather Warnings. Additionally, CWSUs receive scheduled and unscheduled aviation weather products from the NWS via the

computer. CWSUs consolidate this information and disseminate it to the TMCs via a printout.

3.3.2.6 NEXRAD.

NEXRAD is a doppler radar system that is used by CWSUs to provide reflectivity information to TMCs.

3.3.2.7 LSAS.

LSAS is a text-based system that is used by CWSUs as a backup system to disseminate PIREPs and retrieve weather.

4. JTA TASK ANALYSIS DESCRIPTION.

The JTA was developed in two stages. The first stage of the JTA was a research effort in which several reference documents (FAA 7210.3, FAA 7110.10, FAA 7110.65, Air Traffic Weather Needs and Requirements Report, and National Aviation Weather Program Plan) were used to develop task lists for Flight Service Specialists and Traffic Management Coordinators. A list of required information was developed for any task involving weather assessment or dissemination.

Following the compilation of job task lists and weather information requirements, job tasks were depicted using flowcharts. Corresponding weather information requirements were outlined in tables. Weather tables were then further expanded to include the process by which the required information was obtained. Information on the process included sources, interpretation, format, and utility of the weather data associated with the job tasks.

The second stage of the JTA involved confirming the flowcharts and weather tables developed during the first stage. This was accomplished by comparing the flowcharts and weather tables to observed job tasks and weather information requirements of specialists and controllers at an operational site.

4.1 OBSERVATION SCHEDULE AND LOCATIONS.

The observation locations for the JTA were the Ft. Worth AFSS and the Ft. Worth ARTCC TMU. Participants at the Ft. Worth AFSS were observed from January 10, 1994, to January 13, 1994. Participants at the Ft. Worth ARTCC were observed from January 10, 1994, to January 18, 1994. Observations took place between 8 a.m. and 5 p.m. CST.

4.2 PARTICIPANTS.

Participants were Preflight Specialists, Inflight Specialists, and EFAS Specialists from the Ft. Worth AFSS and TMCs from the Ft. Worth ARTCC. All participants were Full Performance Level (FPL) controllers/specialists.

4.3 OBSERVATION TOOLS.

Flowcharts and tables developed during the first stage of the JTA were used as check sheets and observation note forms. Appendix B contains sample forms.

4.4 JOB TASK ANALYSIS OBJECTIVES.

The principal objectives of the JTA were to:

- a. Determine high-level job tasks performed by AFSS Specialists and ARTCC TMCs in an operational setting;
- b. Determine the process by which the weather information required to perform those tasks is obtained and utilized; and
- c. Identify interpretation issues and usability requirements in order to improve future AFSS and ARTCC weather products and systems.

4.5 TESTING DESCRIPTIONS.

Not applicable.

4.6 DATA COLLECTION AND ANALYSIS METHOD.

4.6.1 Data Collection.

4.6.1.1 Ft. Worth AFSS Field Observations.

AFSS Specialists were briefed on the purpose of the JTA prior to the start of observations. Evaluators then observed specialists performing their normal job tasks. While observing the specialists, the evaluator utilized check sheets (see appendix B) to confirm information listed in the flowcharts and weather tables. In addition to visual observations, evaluators listened to specialist/pilot communications using an auxiliary headset. This allowed the evaluators to better understand the types of requests made by pilots and the processes that resulted. Approval was obtained from individual specialists prior to monitoring communications. Specialists were also asked questions regarding the use of systems or weather information.

At the end of the observations, users were debriefed. During the debriefing, users were asked to clarify any information not understood by the evaluator. The controllers were also free to ask any questions relating to the observation sessions and the check sheets.

4.6.1.2 Ft. Worth ARTCC Field Observations.

The observation procedure at the ARTCC was similar to that of the AFSS. TMCs were briefed on the purpose of the JTA prior to the start of observations. The TMU area is much smaller than the AFSS; therefore, it was difficult to actually sit with the TMCs. Instead, evaluators stood behind TMCs while they performed their job tasks.

While observing the TMCs, evaluators utilized check sheets (see appendix B) to confirm information listed in the flowcharts and weather tables. Because of the strong link between the CWSU and the TMC regarding weather, the evaluator also sat with the CWSU to better understand the type of information transferred from the CWSU to the TMC. When time permitted, TMCs were asked questions about their use of weather information.

At the end of the observation, users were debriefed. During the debriefing, controllers were asked to clarify any information not understood by the evaluator. Additionally, the TMCs were free to ask any questions relating to the observation sessions and the flow charts.

4.6.2 Analysis Methodology.

Information was gathered from the reference documents during the research stage of the JTA and was organized into flowcharts and weather information tables (see appendices C through G). Information in the flowcharts and weather tables was compared to the weather information in the Air Traffic Weather Needs and Requirements Report and the National Aviation Weather Program Plan to ensure a correlation between the information in the JTA data collection effort and these reports.

Following the field observations, information collected at the Ft. Worth AFSS and ARTCC was summarized. This information was compared to the original flowcharts and weather tables. Discrepancies were verified and necessary modifications were made to the flowcharts and tables.

The modified flowcharts and weather tables are located in appendices D through G. Instructions regarding the use of the flowcharts and weather tables are outlined in appendix C.

5. RESULTS AND DISCUSSION.

This section presents the findings of the JTA. Results discussed include comparisons of researched and observed job tasks and user-system interface issues.

5.1 JOB TASK COMPARISONS.

5.1.1 Preflight Specialists.

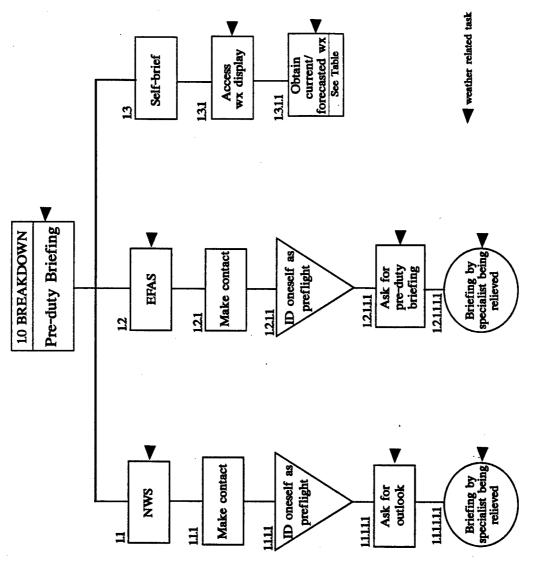

The majority of the information represented in the flowcharts was confirmed during the observation session. All of the specialists performed a self-brief when coming onto the position in lieu of making contact with the NWS or an EFAS Specialist for briefing information as indicated in figure 1 (see Preflight JTA, appendix D for all charts and tables). Making contact with the NWS or an EFAS Specialist was a task outlined in FAA 7110.10. It should be noted, sample size was small (n=9); therefore, it should not be assumed that contacting the NWS or an EFAS Specialist for briefing information does not occur in a larger population.

5.1.2 Inflight Specialists.

The following discrepancies were noted between the information gathered during the first stage of the JTA and the information obtained while observing specialists at the Ft. Worth AFSS:

- a. Contrary to the flowchart depicted in figure 2, Ft. Worth AFSS does not monitor any of the NAVAIDs, Very High Frequency (VHF) Omnidirectional Range (VOR), etc. The FAA is currently moving this task out of the AFSSs (see Inflight JTA, appendix E for all charts and tables).
- b. Ft. Worth AFSS monitors Meacham Field which is a controlled airport; therefore, local airport advisories are not provided to pilots by Inflight Specialists. Figure 3 depicts how local airport advisories are performed by specialists for uncontrolled airports.
- c. The Transcribed Weather Broadcast (TWEB) is not broadcast at Ft. Worth AFSS; however, the facility does broadcast the Hazardous Inflight Weather Advisory Service (HIWAS) and record the Telephone Information Briefing Service (TIBS). Information normally disseminated during the TWEB is outlined in table 1. Similar information is broadcast during the HIWAS and recorded for the TIBS.

NOTE: Discrepancies mentioned are not considered critical and do not affect the core job tasks performed at the AFSS. All other inflight flowcharts and weather tables were confirmed.

PREFLIGHT SPECIALIST SELF-BRIEFING FLOWCHART FIGURE 1.

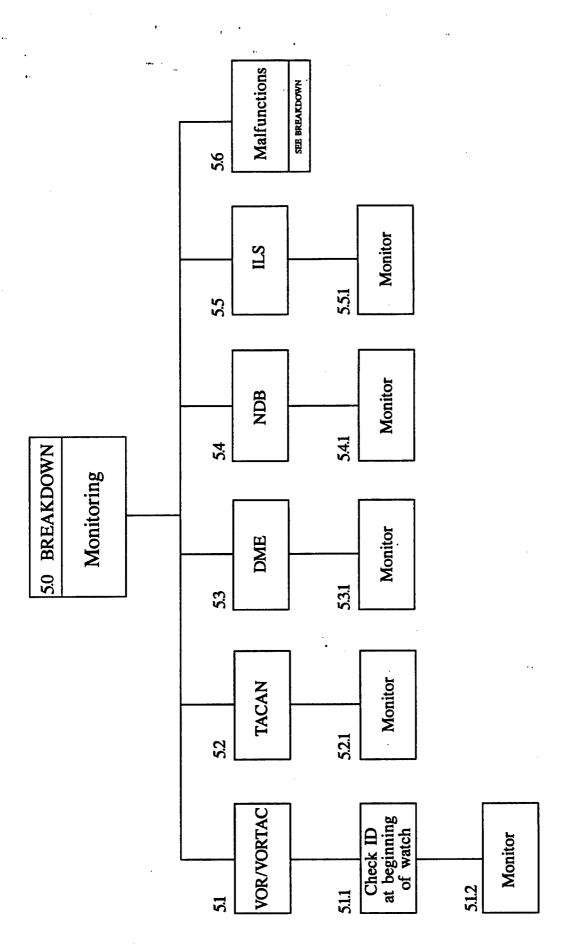

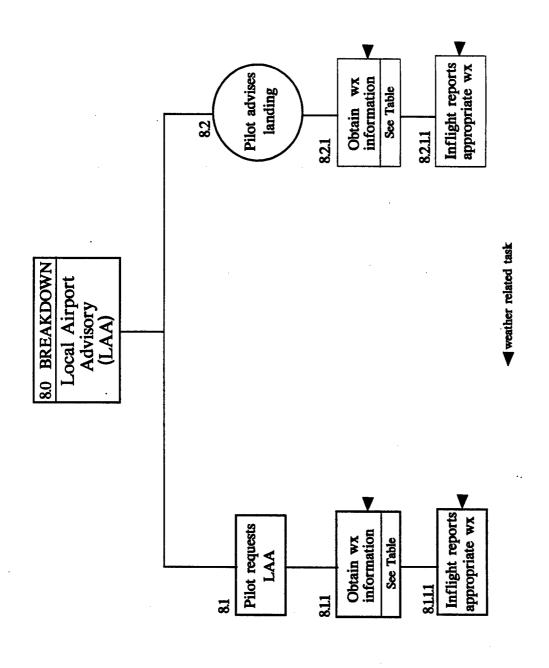

FIGURE 2. INFLIGHT SPECIALIST MONITORING FLOWCHART

INFLIGHT SPECIALIST LOCAL AIRPORT ADVISORY FLOWCHART FIGURE 3.

Obtain AIRMET	Issue hazardous wx	MIFC and facility made graphic wx		Text and graphics	Data is disseminated in broadcast
Obtain Center Wx Advisory	Issue hazardous wx	M1FC and facility made graphic wx		Text and graphics	Data is disseminated in broadcast
Obtain Severe Wx Watch	Issue hazardous wx	M1FC and facility made graphic wx		Text and graphics	Data is disseminated in broadcast

5.1.3 EFAS Specialists.

The information in the flow charts was confirmed during the observation sessions. (See EFAS JTA, appendix F for all charts and tables.)

5.1.4 Traffic Management Coordinators.

Information contained in the flowcharts regarding the job tasks performed by TMCs was confirmed during the observation sessions. (See TMC JTA, appendix G for all charts and tables.) TMU supervisors are briefed at the beginning of each shift by the CWSU meteorologists. Supervisors then brief the TMCs. This briefing was not originally listed in the flowcharts. The briefings given to both TMU supervisors and TMCs are updated as needed by the CWSUs.

5.2 USER-SYSTEM INTERFACE ISSUES.

This section discusses issues related to the user-system interface of weather systems currently in use at AT facilities (see paragraph 3.3). According to the report, <u>Guidelines for Designing User Interface Software</u>, there are six functional areas regarding user-system interfaces. These areas are:

- a. Data Entry User input for data and computer responses to such input;
- b. Data Display Output of data from a computer to the user including visual and auditory output;
- c. Sequence Control Logical means by which user actions and computer responses are linked;
- d. User Guidance Computer prompts and feedback that aid users in performing their tasks;
- e. Data Transmission Computer mediated transmission of data; and
- f. Data Protection Functional capabilities that guard against unauthorized data access or data loss.

During the JTA, issues directly related to the data entry, data display and sequence control functional areas were identified. Therefore, user interface issues will be discussed according to these functional areas.

5.2.1 Data Entry.

Results of the JTA regarding user-system interface data entry issues are discussed in this section.

5.2.1.1 AFSS.

The following AFSS issues were identified:

- a. Most AFSS Specialists utilize locally produced graphics. These graphics are created by specialists using the text information from AIRMETS, SIGMETS, and Convective SIGMETS. Specialists utilize a drawing function on the vendor system to draw colored lines around the area affected by the meteorological warning (see figure 4). The process of manually drawing these graphics is time-consuming and tedious. If there are several AIRMETS or SIGMETS, creating the graphics can take up to 30 minutes. At Ft. Worth AFSS, the graphics are updated approximately every 2 to 3 hours.
- b. Flight plans can be recorded using paper and pencil or using the M1FC. Flight plan filing on the M1FC is accomplished via a form-fill type screen. The specialist tabs to the appropriate field and types in the necessary information. During the observation sessions, it was noted by the evaluator that the form is not organized according to the way most flight plan information is disseminated. Several specialists had to continuously tab from the beginning of the form to the end of the form to enter data. There are slight format differences between paper and electronic flight plans.

5.2.1.2 TMC.

No data entry issues were identified for TMC systems.

5.2.2 Data Display.

Results of the JTA regarding user-system interface data display issues are discussed in this section.

5.2.2.1 AFSS.

The following AFSS issues were identified:

a. The area forecast and the enroute weather forecast are included in a standard weather briefing which is outlined in table 2. These forecasts are obtained from the M1FC in a text format. The forecasts are then confirmed using vendor graphic weather products, SAOs, locally produced graphics, and satellite

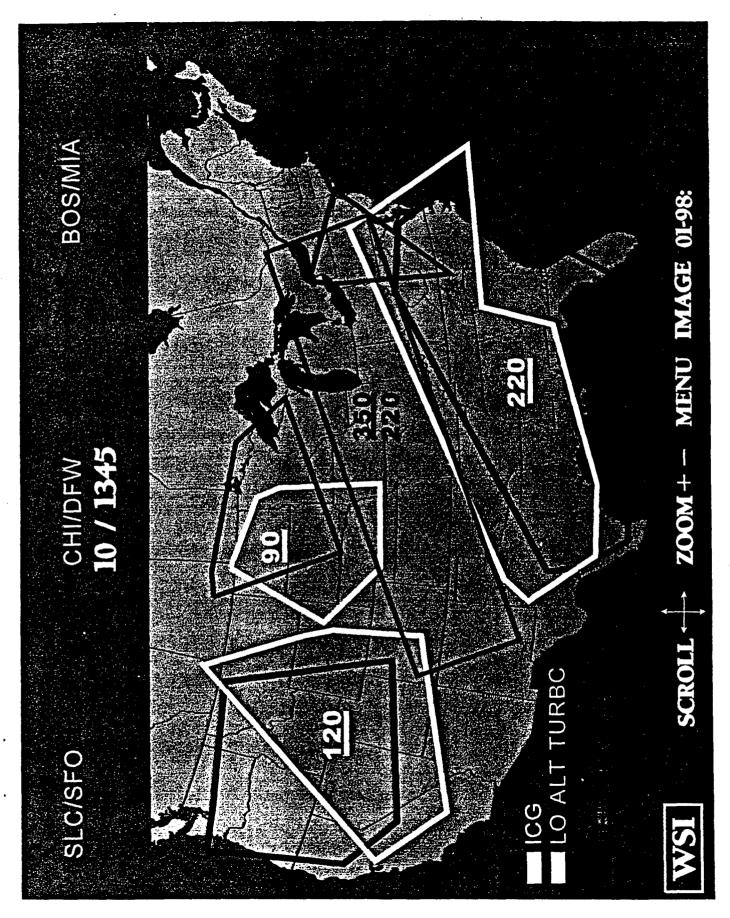

TABLE 2. STANDARD WEATHER BRIEFING MIFC OUTPUT

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
Obtain adverse wx conditions	Check adverse wx that would affect flight	MIFC		Text	Adverse wx may alter flight plan
Obtain LLWAS	Check for Approach and Departure	MIFC	Confirm with PIREPs	Text	Light aircraft may be unable to navigate
Obtain thunder- Storms	Check for Hazardous wx	M1FC, radars, and vendor graphic wx		Text and graphics	May cause delay or alter flight plan
Obtain icing	Check for Hazardous wx	M1FC and facility graphic wx	Confirm with PIREPs and verify info	Text and graphics	May make change in alt. Necessary
Obtain weather advisories	Check for hazardous wx	M1FC and vendor graphic wx	Confirm with radar and PIREPs	Text and graphics	May cause delay or alter flight plan
Obtain weather depiction	Look for areas of VFR/IFR	Vendor graphic wx	Confirm using GOES and SA	Graphics	Look for IFR cond./alternate airport
Obtain satellite imagery	Used to verify wx information	Vendor graphic wx	Compare to surface chart, SA, prog chart	Graphics	Monitoring of cloud coverage/ frontal zones
Obtain terminal forecast	Provides terminal area forecast	MlFC	Compare to SA conditions, and radar	Text	Provides wx in terminal area and airports

TABLE 2. STANDARD WEATHER BRIEFING (CONTINUED)

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
Obtain synopsis	Provide locn and mvmt of wx systems	M1FC and vendor graphic wx	Compare to satellite imagery	Text and graphics	Used for short and long range briefing
Obtain current Conditions	Summarize SA's, PIREPs, RAREPs	MIFC	Confirm using MIFC and PIREPs	Text	Used to create a summary of current wx
Obtain en- route wx forecast	Provide forecast along route	M1FC and vendor graphic wx	Comparing text and graphic information	Text and graphics	Provide wx for climb, en route, descent
Obtain area forecast	Provide forecast along route	MlFC	Compare wx from M1FC to radar	Text	Summarizes hazardous wx over area
Look at prognosis Charts	Provide forecast along route	Vendor graphic wx		Graphics	Note deviations from FA and FT
Check destination forecast	Provide forecast wx for dstn.	MIFC		Text	Provides expected wx at destination
Obtain winds aloft	Provide wind speed and direction	M1FC and vendor graphic wx	Interpolate winds from MIFC btwn alt.	Text and graphics	Provide best altitude for flight
Obtain PIREPs	Request for pilot reports	Radio and M1FC	Used to confirm M1FC and vendor wx	Verbal info and text	Used to compare actual vs. forecast

- imagery. Based on specialist comments, it appears these comparisons may increase task difficulty since the specialists are comparing textual weather information to graphical weather information. This difference in format is likely to increase interpretation time which, in turn, decreases task efficiency. The impact of this inefficiency would be greatest during time critical high traffic periods. Specialists reported the forecasts would be easier to use if they were in a graphical format.
- b. The M1FC displays winds aloft at 3000, 6000, 9000, 12,000, 15,000, 18,000, 21,000, 24,000, 27,000, 30,000, 33,000, 36,000, and 39,000 feet above Mean Sea Level (MSL) (see appendix A). Most specialists directly read the winds at those flight levels; however, specialists may be asked to interpolate the winds aloft information between flight levels for the pilot. Given that specialists mentally interpolate winds aloft between flight levels, this process is likely to increase the amount of time spent analyzing and interpreting selected weather.
- c. PIREPs are presented in a text format on the M1FC (see appendix A). PIREPs are used often to confirm information obtained from M1FC and the vendor weather systems. In addition, PIREPs are given to pilots as additional weather information when applicable. When PIREPs are received over the radio, the specialist must type the information into the M1FC. In order to use PIREPs effectively, specialists reported that they have to interpret the PIREPs and mentally place them along the route of flight.
- M1FC provides large amounts of text information. of this information is considered to be quite valuable to the specialist; however, the users reported it was difficult to visualize and interpret. Additionally, specialists reported they must constantly filter considerable amounts of information at the time of a request. This filtering process is performed in order to better organize the information and make it more usable. example, a standard weather briefing on the M1FC (see figure 5) presents information in the order of dissemination. However, if a specialist needs to obtain any other weather information (e.g., outlook briefing, abbreviated briefing), they must filter through the M1FC output and mentally organize it. The filtering process appears to impact EFAS Specialists more because they are responsible for a larger geographical area. The inflight specialist may be able to maintain a clearer picture of enroute weather since their area of responsibility is significantly smaller than the EFAS Specialist.
- e. Both the M1FC and vendor weather systems display weather products that lack high-resolution data and that are not realtime. Specialists reported this was very frustrating as it

increased the specialist's lack of confidence in their weather information. This lack of confidence increases the likelihood of making more comparisons across systems and products to ensure accuracy. This leads to increased interpretation time.

5.2.2.2 TMC.

As mentioned earlier, TMCs receive most of their pre-duty weather and weather updates from the CWSU meteorologist (see paragraph 3.3.2). However, since CWSU meteorologists operate during limited hours usually between 6 a.m. and 10 p.m.; therefore, TMCs are required to interpret radar and other products presented on the MWP briefing terminals. Most of the weather information on the MWP is in a graphic format; however, some products such as AIRMETS, SIGMETs and Convective SIGMETs, are presented in a text format. TMCs indicated these products might be more efficiently represented in a graphical format.

5.2.3 Sequence Control.

Results from the JTA involving issues related to user-system interface sequence control issues are discussed in this section.

5.2.3.1 AFSS.

The following user-system interface sequence control issues were identified:

- a. The WSI graphical weather displays at the Ft. Worth AFSS are accessed via a keypad on which the specialist types the number of the display needed. Most specialists have the numbers for the more commonly used displays memorized; however, when the specialist cannot remember a display number, they must look through a list of 98 display titles to find the appropriate display number. This appears to be both time-consuming and frustrating. The Kavouras, Inc. graphical weather displays are also accessed via a keypad. However, Kavouras menus have a more semantic representation where specialists have titles associated with the top-level menus and use numerics to access submenus. This representation has a possible drawback of having a user becoming "lost" in the layering of the submenus.
- b. Commands for the MIFC must be typed in. This is not a problem for a single item request; however, when a pilot requests several pieces of information, or when the specialist has to obtain weather information from another area of the country, these commands become tedious. In addition, it was noted during the observation sessions that typing errors increased frustration levels and response time. Typing errors also resulted in the retrieval of incorrect information.

5.2.3.2 TMC.

During the evaluation, it was noted that the TMCs had to access several weather systems to retrieve all of the necessary weather (ASD, MWP, KBVT). This normally occurred when the CWSU meteorologist was off duty. Each of these systems has a different user-system interface. Therefore, TMCs are using several different systems each with unique interfaces to access necessary weather. This was reported by the TMCs to be time-consuming.

6. CONCLUSIONS.

In general, the information gathered during the observations verified the Job Task Analysis (JTA) flowcharts and weather tables. In addition to the flowchart verifications, issues involving the handling, availability, and interpretation of weather information were noted.

The following conclusions were reached:

- a. Accessing and comparing weather information from several systems to ensure weather accuracy (see paragraph 5.2.2.1, 5.2.3.2) is time-consuming and may lead to increased task difficulty as well as increased levels of workload.
- b. Attempting to relate graphical and textual weather information (see paragraph 5.2.2.1) may increase the amount of mental interpretation required to properly utilize products. Increased interpretation may lead to increased levels of task difficulty and workload.
- c. The need to read, interpret and mentally filter several pages of Model 1 Full Capacity (M1FC) text (see paragraph 5.2.2.1) is time-consuming and inefficient.
- d. Locally produced graphics are an attempt at reducing the amount of textual information (see paragraph 5.2.1.1); however, the process of creating these graphics is time-consuming and needs to be improved.
- e. Command line interfaces (typing in requests) on some of the current weather systems are tedious and time-consuming (see paragraph 5.2.3.1). Additionally, this interaction becomes time consuming and frustrating when typographical errors are made.
- f. Current vendor graphic weather systems are based on a user interface that is not efficient and requires too many user inputs for each request and/or action (see paragraph 5.2.3.1).

7. RECOMMENDATIONS.

Based on the above mentioned conclusions, several recommendations for new aviation weather products are suggested. The following recommendations should be utilized in the development of future systems and products:

- a. Integrate weather products onto one existing platform or create a single weather platform that allows Air Traffic (AT) personnel to access all necessary weather information. This will eliminate time spent comparing weather information from one system to that obtained from another system.
- b. Spatial and temporal products (e.g., icing, turbulence, precipitation, winds aloft) should be represented graphically. In contrast, highly detailed, site-specific weather information (e.g., Surface Aviation Observations (SAOs), Terminal Forecasts) should be presented to the user in a textual format. Regardless of format, all information should be presented using one system. This report's findings correlate with the findings from the Guidelines for Designing User Interface Software report in that both reports suggest graphical representation be used to display data showing relations in space and time.
- c. Organize large outputs of weather information in a meaningful manner so as to not overload the controller or specialist. This may be best accomplished by organizing weather information in smaller and more applicable formats. The output should be tailored to individual tasks. For example, a product-by-product output resembling the sequence of a standard weather briefing would provide smaller, more meaningful pieces of information for specialists.
- d. The creation of locally produced graphics should be automated.
- e. Design user interfaces so that controllers and specialists can accomplish a task using as few steps as possible. The menuing system should be organized so that it represents the nature of the tasks to be completed. It should be noted that an intuitive and efficient interface may require both trackball type, command line, and function key input.
- f. Pilot Reports (PIREPs) may be represented more efficiently in a graphical presentation. Some specialists reported that they mentally place PIREPs along the route of flight. Graphical depiction of PIREPs along the route of flight could relieve controllers from this mental tracking task.

Standard Text

Tropical Storm Beryl is moving North-Northeastward 6 to 10 Knots into Southwestern Georgia. A large area of convection continues over Northeastern Gulf of Mexico. Strongest activity will be moving on shore during next several hours. Quasi-stationary front stretches from Northeastern North Carolina to Southwestern North Carolina and Northern Alabama to Central Alabama. Thunderstorms continue but have been weakening along North Carolina Coast.

Appendix C JTA Instructions

JTA Instructions

The flowcharts found in appendices D through G depict job tasks for Flight Service Station Specialists and Traffic Management Unit Coordinators. Each position (ie., Inflight Specialist, EFAS Specialist, Preflight Specialist, and TMC) job tasks' are organized into its own set of flowcharts.

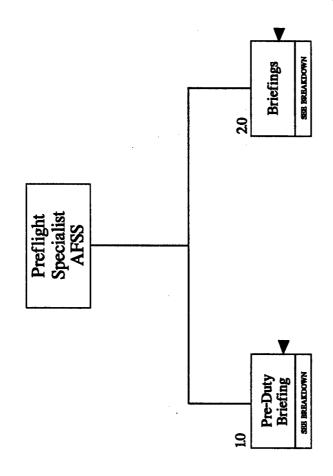

The flowcharts include several different symbols. Each symbol characterizes the task associated with that symbol according to the physical or cognitive process that is required to complete the task. For instance, the rectangle symbol categorizes the information in that symbol as a process or action. A complete list of the flowchart symbology is illustrated figure C-1.

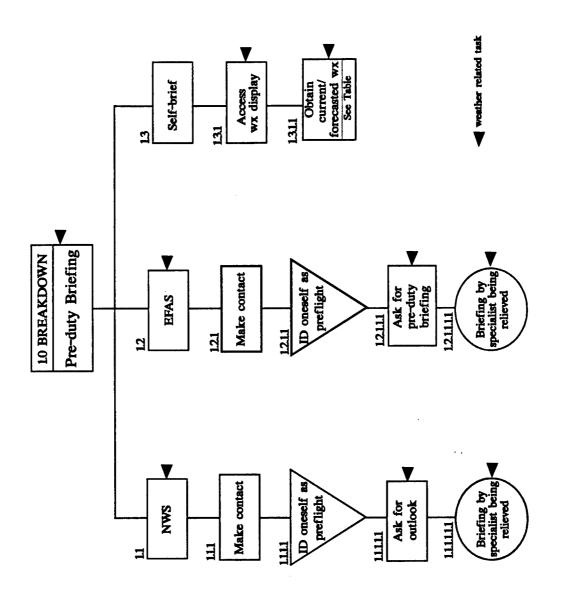

Additionally, some rectangles are divided into two parts. The lower part of this symbol directs the reader to either a more detailed breakdown of the tasks associated with that symbol or a weather table associated with the information in that symbol. For instance, component 1.0 of the Inflight Specialist title chart directs the reader to another chart that further breaks down the subtasks associated with a pre-duty briefing. Similarly, component 1.3.1.1 of flowchart 1.0 for the Inflight Specialist directs the reader to a weather table. The reader will note that the weather table shares the same number as the symbol that refers to the weather table. The weather table outlines the type of weather information required to complete the task and how that information is retrieved.

Aviation and meteorology specific terminology is utilized in the Job Task Analysis. Therefore, for the reader's convenience, appendix H contains definitions of aviation specific terms while appendix I contains definitions of meteorology specific terms.

Process or Action (e.g., control operation)
Transmitted Information
Received Information through Weather Sources (e.g., indicator light, weather display)
Operator Decision
Previously Stored Information (e.g., knowledge)

Appendix D Preflight Specialists JTA

1.3.1.1 Obtain Current and Forecasted Weather

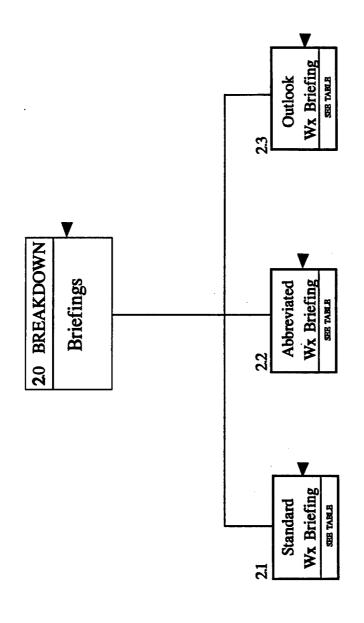

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility

2.1 Standard Weather briefing

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
obtain adverse wx conditions	Check adverse Wx that would affect flight	M1FC		Text	Adverse wx may alter flight plan
obtain LLWAS	Check for Approach and Departure	MIFC	Confirm with PIREPs	Text	Light aircraft may be unable to navigate
obtain thunder- storms	Check for Hazardous wx	M1FC, radars, And vendor graphic wx		Text and graphics	May cause delay or alter flight plan
obtain icing	Check for Hazardous wx	M1FC and facility graphic wx	Confirm with PIREPs and verify info	Text and graphics	May make change in alt. Necessary
obtain weather advisories	Check for hazardous wx	M1FC and vendor graphic wx	Confirm with radar and PIREPs	Text and graphics	May cause delay or alter flight plan
obtain weather depiction	Look for areas of VFR/IFR	Vendor graphic wx	Confirm using GOES and SA	Graphics	Look for IFR cond./alternate airport

2.1 Standard Weather Briefing (Continued)

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
Obtain satellite imagery	Used to verify wx information	Vendor graphic wx	Compare to surface chart, SA, prog chart	Graphics	Monitoring of cloud coverage/ frontal zones
Obtain terminal forecast	Provides terminal area forecast	MlfC	Compare to SA conditions,	Text	Provides wx in terminal area and airports
Obtain synopsis	Provide locn and mvmt of wx systems	M1FC and vendor graphic wx	Compare to satellite imagery	Text and graphics	Used for short and long range briefing
Obtain current Conditions	Summarize SA's, PIREPs, RAREPs	MIFC	Confirm using MIFC and PIREPs	Text	Used to create a summary of current wx
Obtain en- route wx forecast	Provide forecast along route	M1FC and vendor graphic wx	Comparing text and graphic information	Text and graphics	Provide wx for climb, en route, descent
Obtain area forecast	Provide forecast along route	MIFC	Compare wx from M1FC to radar	Text	Summarizes hazardous wx over area

2.1 Standard Weather Briefing (Continued)

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
Look at prognosis Charts	Provide forecast along route	Vendor graphic wx		Graphics	Note deviations from FA and FT
Check destination forecast	Provide forecast wx for dstn.	MlfC		Text	Provides expected wx at destination
Obtain winds aloft	Provide wind speed and direction	M1FC and vendor graphic wx	Interpolate winds from MIFC btwn alt.	Text and graphics	Provide best altitude for flight
Obtain PIREPs	Request for pilot reports	Radio and MIFC	Used to confirm M1FC and vendor wx	Verbal info and text	Used to compare actual vs. forecast

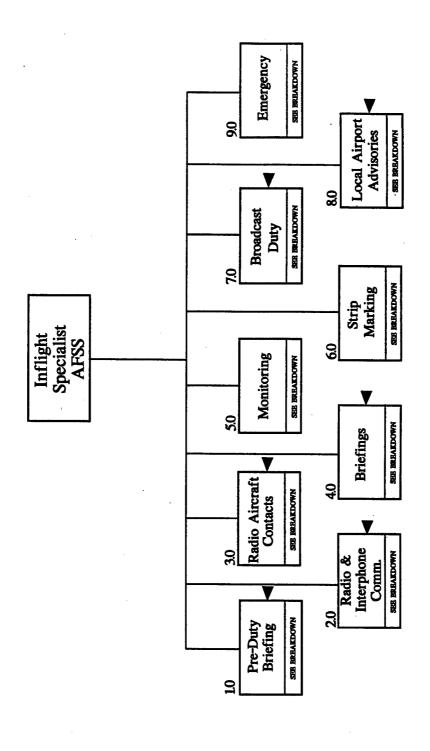

2.2 Abbreviated Weather Briefing

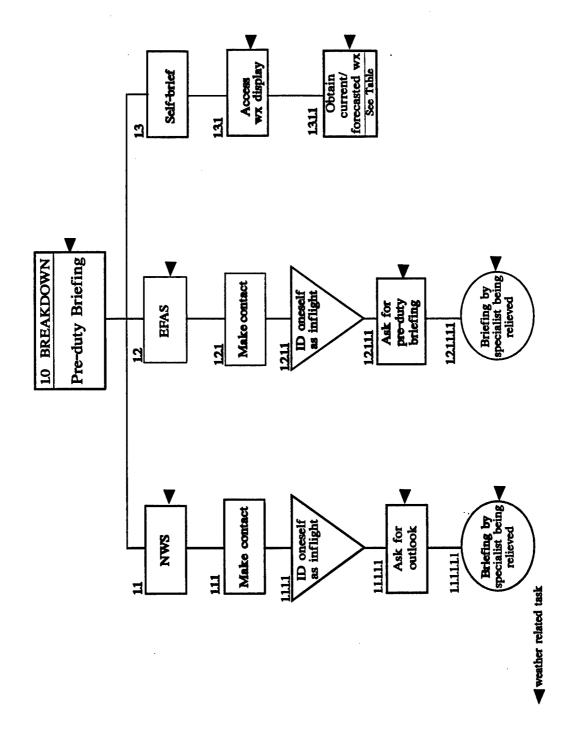

Task Elements	Purpose	Information Source	User Interpretation	Information Format	מביוזנא
Brief pilot On requested info	Provide pilot with requested wx	M1FC, vendor graphic wx, and radars		Text and graphics	Give data not recieved in earlier brief
Obtain adverse wx information	Provide pilot with adverse wx conditions	M1FC and vendor graphic wx		Text and graphics	May cause change in flight plan
Update pilot info if new info avail.	Provide new wx since last brief	M1FC and vendor graphic wx	•	Text and graphics	May cause change in flight plan
Solicit pilot reports	Need for pilot reported wx	M1FC and radio contact	Used to confirm M1FC and vendor wx	Text and verbal information	Used to check for un- forecasted wx

2.3 Outlook Briefing

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
Obtain adverse weather	Provide pilot with forecast adverse wx	M1FC and vendor graphic wx		Text and graphics	Provide pilot with weather update
Obtain weather depiction	Recommend VFR/IFR	M1FC and vendor graphic wx	Confirm with GOES and SA	Text and graphics	Look for area IFR/VFR conditions
Obtain synopsis	Statement of locn and mymt of wx masses	M1FC and vendor graphic wx		Text and graphics	Check for frontal zone/ alter flight
Obtain en- route forecast	Provide forecast along route	M1FC and vendor graphic wx	Comparing text and graphic wx information	Text and graphics	May cause change in flight plan
Check destination forecast	Provide forecast for destination	M1FC and vendor graphic wx		Text and graphics	May need alternate airport

Appendix E Inflight Specialists JTA

1.3.1.1 Obtain Current and Forecasted Weather

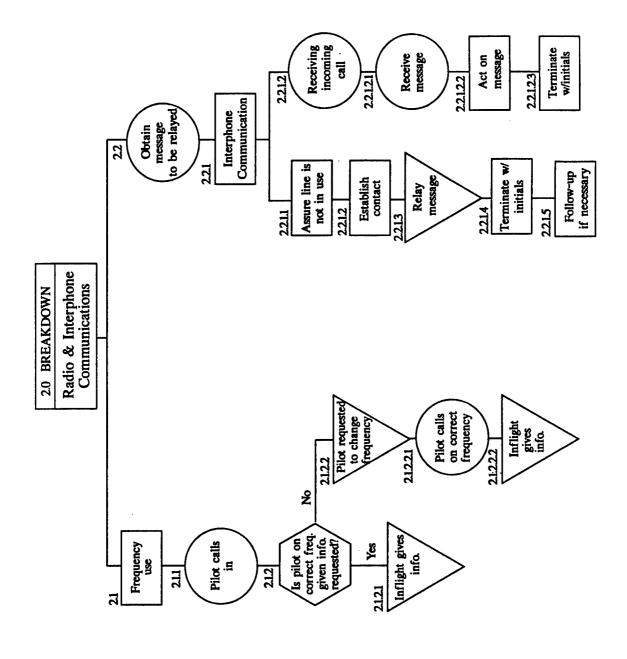

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
Obtain adverse wx conditions	Perform self brief	M1FC and vendor graphic wx		Text and graphics	May cause pilot to change flight plan
Obtain LLWAS	Check for approach and departure	MIFC	Confirm using PIREPs	Text	Light aircraft may be affected by LLWAS
Obtain thunder- Storms	Check for hazardous wx	M1FC, radar, and vendor graphic wx		Text and graphics	May cause change in flight plan
Obtain icing and turbulence	Check for hazardous wx	M1FC, facility graphic wx and vendor graphics weather	Confirm with PIREPs/verify intensity	Text and graphics	May make change in altitude and flight plan necessary
Obtain weather Advisories	Check for hazardous wx	M1FC and facility graphic wx	Confirm with radar and PIREPs	Text and graphics	May cause change in flight plan

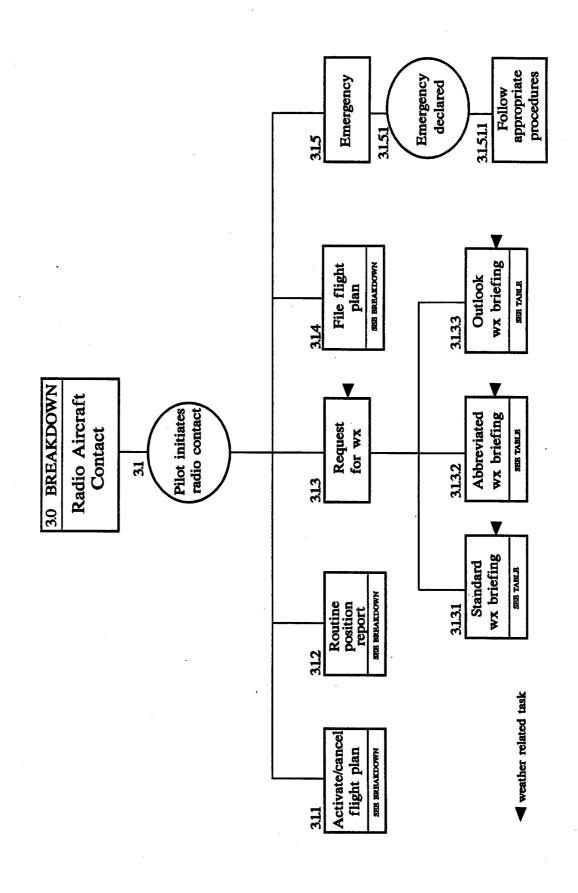

1.3.1.1 Obtain Current and Forecasted Weather (Continued)

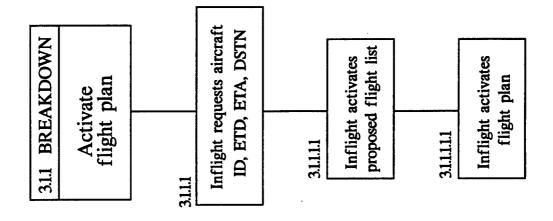

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
Obtain weather depiction	Look for areas of VFR/IFR	M1FC and vendor graphic wx	Confirm using GOES and SA	Text and graphics	Look for IFR cond./alternate airport
Obtain synopsis	Provide locn and mvmt of wx systems	M1FC and vendor graphic wx	Compare to satellite imagery	Text and graphics	Check for new location of frontal zones
Obtain terminal forecast	Provide terminal area wx	MIFC	Compare to SA conditions and radar	Text	Update any changes since departure time
Obtain current conditions	Summarize SA, PIREPs, and RAREPs	M1FC and vendor graphics	Confirm using M1FC, PIREPs, and GOES	Text and graphics	Change in cond. May change flight plan
Obtain satellite imagery	Used to verify wx information	Vendor graphic wx	Compare to surface chart, SA, prog chart	Graphics	Aids in monitoring cloud movement
Obtain en- route wx forecast	Provide forecast along route	Mirc and vendor graphic wx	Comparing text and graphic information	Text and graphics	Wx info needed for en route and descent

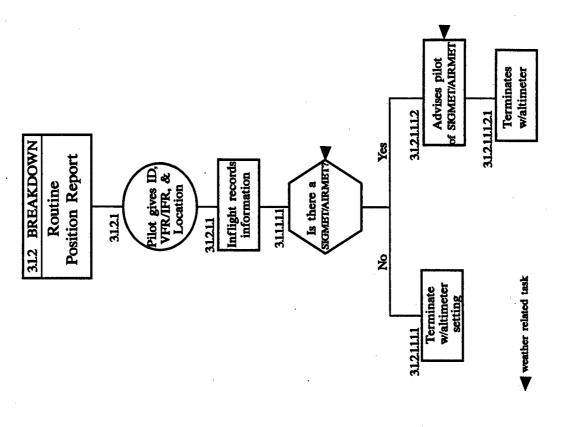

1.3.1.1 Obtain Current and Forecasted Weather (Continued)

Task Elements	Purpose	Information Source	User Interpretation	Information Format	υτίλτη
Obtain area forecast	Provide forecast along route	MlFC	Compare wx from M1FC to radar and GOES	Text	Summary of forecast for area weather
View prognosis Charts	Provide forecast along route	Vendor graphic wx		Graphics	Aids in noting deviations btwn FA and FT
Obtain winds aloft	Provide wind speed and dir	M1FC and vendor graphic wx	Interpolate winds from M1FC btwn alt.	Text and graphics	Provides best altitude for route of flight
Obtain upper air moisture	Provides frzglvl, RH, K index	Vendor graphic wx	Compare to RADAT readings from M1FC	Graphic	May cause change in flight plan
Obtain PIREPs	Request for pilot reports	Radio request and M1FC	Used to confirm M1FC and vendor wx	Verbal info and text	Verifies any unforecasted wx conditions

Standard Weather briefing

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
Obtain adverse wx conditions	Check adverse wx that would affect flight	MlfC		Text	Adverse wx may alter flight plan
Obtain LLWAS	Check for approach and departure	M1FC	Confirm with PIREPs	Text	Light aircraft may be unable to navigate
Obtain thunder- Storms	Check for hazardous wx	M1FC, radars, and vendor graphic wx		Text and graphics	May cause delay or alter flight plan
Obtain icing	Check for hazardous wx	M1FC and facility graphic wx	Confirm with PIREPs and verify info	Text and graphics	May make change in alt. Necessary
Obtain weather advisories	Check for hazardous wx	M1FC and vendor graphic wx	Confirm with radar and PIREPs	Text and graphics	May cause delay; or alter flight plan
Obtain weather depiction	Look for areas of VFR/IFR	Vendor graphic wx	Confirm using GOES and SA	Graphics	Look for IFR cond./alternate airport

3.1.3.1 Standard Weather Briefing (Continued)

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
Obtain satellite imagery	Used to verify wx information	Vendor graphic wx	Compare to surface chart, SA, prog chart	Graphics	Monitoring of cloud coverage/ frontal zones
Obtain terminal forecast	Provides terminal area forecast	MIFC	Compare to SA conditions,	Text	Provides wx in terminal area and airports
Obtain synopsis	Provide locn and mvmt of wx systems	M1FC and vendor graphic wx	Compare to satellite imagery	Text and graphics	Used for short and long range briefing
Obtain current Conditions	Summarize SA's, PIREPs,RAREPs	MlfC	Confirm using M1FC and PIREPs	Text	Used to create a summary of current
Obtain en- route wx forecast	Provide forecast along route	M1FC and vendor graphic wx	Comparing text and graphic information	Text and graphics	Provide wx for climb, en route, descent
Obtain area forecast	Provide forecast along route	MIFC	Compare wx from M1FC to radar	Text	Summarizes hazardous wx over area

3.1.3.1 Standard Weather Briefing (Continued)

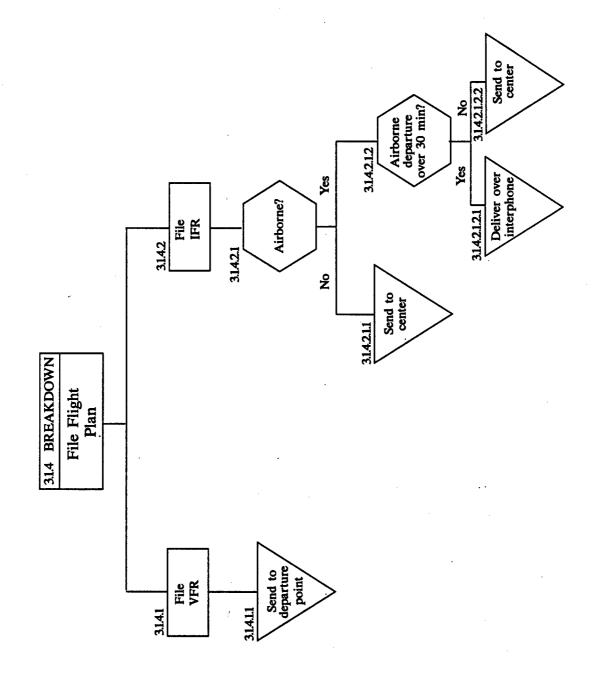

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
Look at prognosis Charts	Provide forecast along route	Vendor graphic wx		Graphics	Note deviations from FA and FT
Check destination forecast	Provide forecast wx for dstn.	MIFC		Text	Provides expected wx at destination
Obtain winds aloft	Provide wind speed and direction	MIFC and vendor graphic wx	Interpolate winds from MIFC btwn alt.	Text and graphics	Provide best altitude for flight
Obtain PIREPs	Request for pilot reports	Radio and MIFC	Used to confirm MIFC and vendor wx	Verbal info and text	Used to compare actual vs. forecast

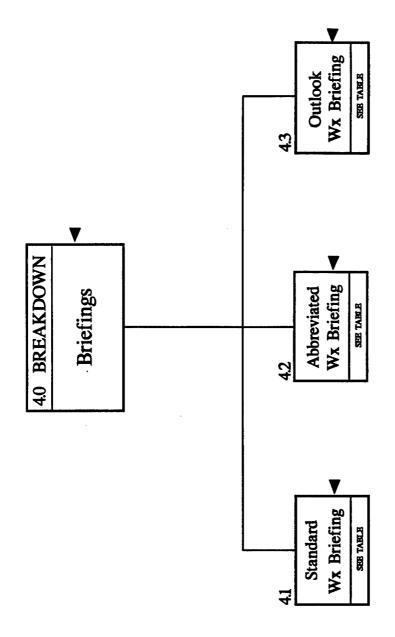

3.1.3.2 Abbreviated Weather Briefing

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
Brief pilot On requested info	Provide pilot with requested wx	M1FC, vendor graphic wx, and radars		Text and graphics	Give data not recieved in earlier brief
Obtain adverse wx information	Provide pilot with adverse wx conditions	M1FC and vendor graphic wx		Text and graphics	May cause change in flight plan
Update pilot info if new info avail.	Provide new wx since last brief	M1FC and vendor graphic wx		Text and graphics	May cause change in flight plan
Solicit pilot reports	Need for pilot reported wx	M1FC and radio contact	Used to confirm M1FC and vendor wx	Text and verbal information	Used to check for un- forecasted wx

3.1.3.3 Outlook Briefing

Task Elements	Purpose	Information Source	User Interpretation	Information Format	υτίιτη
Obtain adverse weather	Provide pilot with forecast adverse wx	M1FC and vendor graphic wx		Text and graphics	Provide pilot with weather update
Obtain weather depiction	Recommend VFR/IFR	M1FC and vendor graphic wx	Confirm with GOES and SA	Text and graphics	Look for area IFR/VFR conditions
Obtain synopsis	Statement of locn and mymt of wx masses	M1FC and vendor graphic wx	·	Text and graphics	Check for frontal zone/ alter flight
Obtain en- route forecast	Provide forecast along route	M1FC and vendor graphic wx	Comparing text and graphic wx information	Text and graphics	May cause change in flight plan
Check destination forecast	Provide forecast for destination	M1FC and vendor graphic wx		Text and graphics	May need alternate airport

4.1 Standard Weather briefing

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
Obtain adverse wx conditions	Check adverse Wx that would affect flight	MIFC		Text	Adverse wx may alter flight plan
Obtain LLWAS	Check for Approach and Departure	M1FC	Confirm with PIREPs	Text	Light aircraft may be unable to navigate
Obtain thunder- Storms	Check for Hazardous wx	M1FC, radars, And vendor graphic wx		Text and graphics	May cause delay or alter flight plan
Obtain icing	Check for Hazardous wx	M1FC and facility graphic wx	Confirm with PIREPs and verify info	Text and graphics	May make change in alt. Necessary
Obtain weather advisories	Check for hazardous wx	M1FC and vendor graphic wx	Confirm with radar and PIREPs	Text and graphics	May cause delay or alter flight plan
Obtain weather depiction	Look for areas of VFR/IFR	Vendor graphic wx	Confirm using GOES and SA	Graphics	Look for IFR cond./alternate airport

4.1 Standard Weather Briefing (Continued)

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
Obtain satellite imagery	Used to verify wx information	Vendor graphic wx	Compare to surface chart, SA, prog chart	Graphics	Monitoring of cloud coverage/ frontal zones
Obtain terminal forecast	Provides terminal area forecast	M1FC	Compare to SA conditions,	Text	Provides wx in terminal area and airports
Obtain synopsis	Provide locn and mvmt of wx systems	M1FC and vendor graphic wx	Compare to satellite imagery	Text and graphics	Used for short and long range briefing
Obtain current Conditions	Summarize SA's, PIREPs, RAREPs	M1FC	Confirm using M1FC and PIREPs	Text	Used to create a summary of current
Obtain en- route wx forecast	Provide forecast along route	M1FC and vendor graphic wx	Comparing text and graphic information	Text and graphics	Provide wx for climb, en route, descent
Obtain area forecast	Provide forecast along route	M1FC	Compare wx from M1FC to radar	Text	Summarizes hazardous wx over area

4.1 Standard Weather Briefing (Continued)

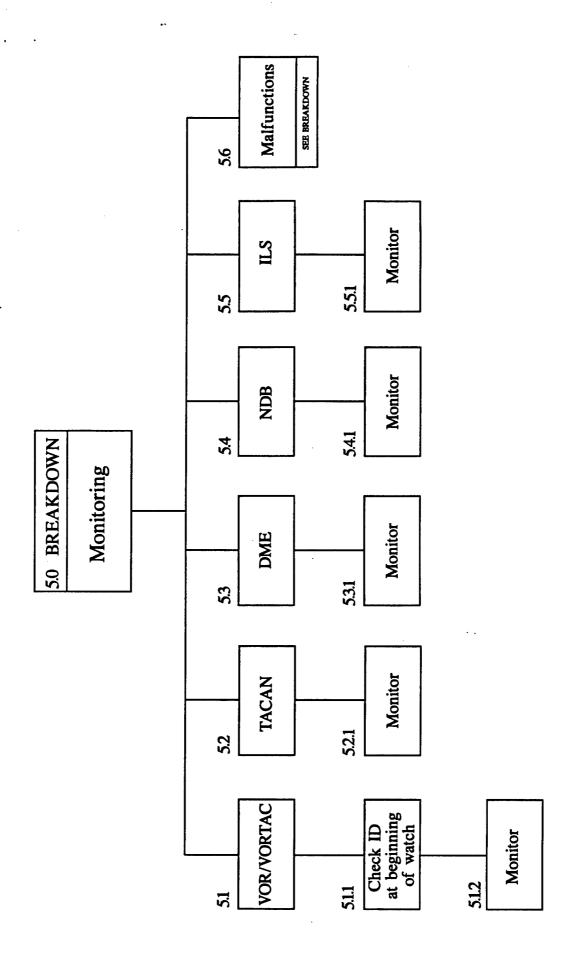

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
Look at prognosis Charts	Provide forecast along route	Vendor graphic wx		Graphics	Note deviations from FA and FT
Check destination forecast	Provide forecast wx for dstn.	M1FC		Text	Provides expected wx at destination
Obtain winds aloft	Provide wind speed and direction	M1FC and vendor graphic wx	Interpolate winds from MIFC btwn alt.	Text and graphics	Provide best altitude for flight
Obtain PIREPs	Request for pilot reports	Radio and M1FC	Used to confirm MIFC and vendor wx	Verbal info and text	Used to compare actual vs. forecast

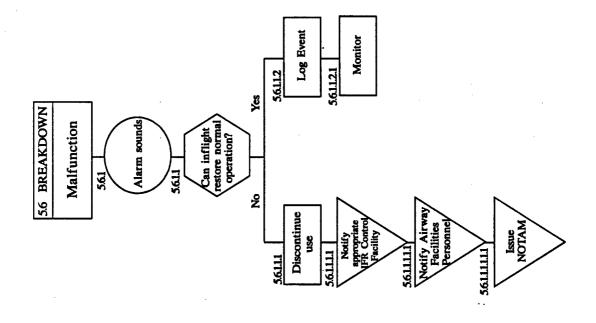

4.2 Abbreviated Weather Briefing

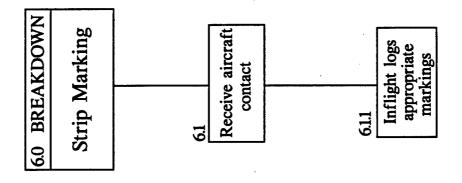

Task Elements	Boding	Information Source	User Interpretation	Information Format	Utility
Brief pilot On requested info	Provide pilot with requested wx	M1FC, vendor graphic wx, and radars		Text and graphics	Give data not recieved in earlier brief
Obtain adverse wx information	Provide pilot with adverse wx conditions	M1FC and vendor graphic wx		Text and graphics	May cause change in flight plan
Update pilot info if new info avail.	Provide new wx since last brief	M1FC and vendor graphic wx		Text and graphics	May cause change in flight plan
Solicit pilot reports	Need for pilot reported wx	MIFC and radio contact	Used to confirm M1FC and vendor wx	Text and verbal information	Used to check for un- forecasted wx

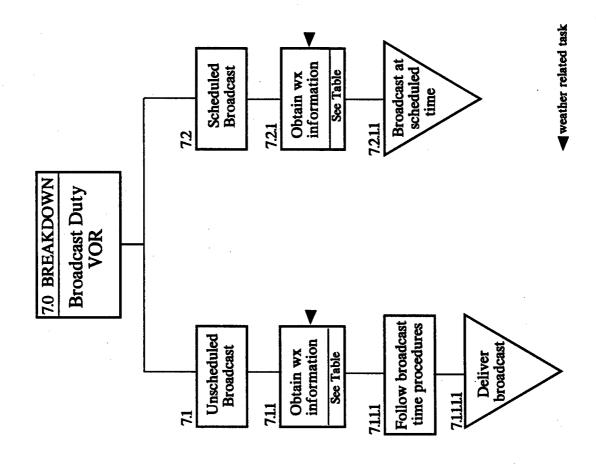

4.3 Outlook Briefing

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
Obtain adverse weather	Provide pilot with forecast adverse wx	M1FC and vendor graphic wx		Text and graphics	Provide pilot with weather update
Obtain weather depiction	Recommend VFR/IFR	M1FC and vendor graphic wx	Confirm with GOES and SA	Text and graphics	Look for area IFR/VFR conditions
Obtain synopsis	Statement of locn and mvmt of wx masses	M1FC and vendor graphic wx		Text and graphics	Check for frontal zone/ alter flight
Obtain en- route forecast	Provide forecast along route	M1FC and vendor graphic wx	Comparing text and graphic wx information	Text and graphics	May cause change in flight plan
Check destination forecast	Provide forecast for destination	M1FC and vendor graphic wx		Text and graphics	May need alternate airport

7.1.1 Obtain weather information

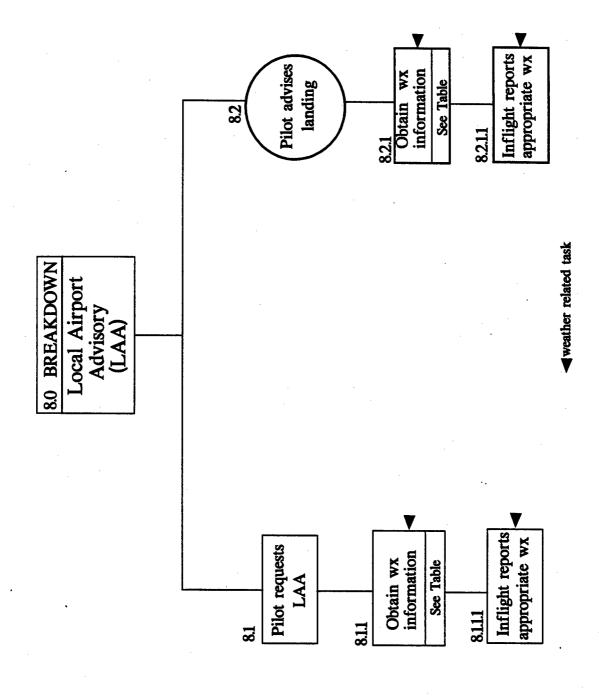

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
Obtain convective SIGMET	Issue hazardous wx	M1FC and facility made graphic wx		Text and graphics	Data is disseminated in broadcast
Obtain SIGMET	Issue hazardous wx	MIFC and facility made graphic wx		Text and graphics	Data is disseminated in broadcast
Obtain AIRMET	Issue hazardous wx	M1FC and facility made graphic wx		Text and graphics	Data is disseminated in broadcast
Obtain Center Wx Advisory	Issue hazardous wx	M1FC and facility made graphic wx		Text and graphics	Data is disseminated in broadcast
Obtain Severe Wx Watch	Issue hazardous wx	M1FC and facility made graphic wx		Text and graphics	Data is disseminated in broadcast

7.2.1 Obtain Weather Information

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
Obtain Synopsis	Issue hazardous wx	M1FC and vendor graphic wx		Text and graphics	Provides hazardous wx for broadcast
Obtain convective SIGMET	Issue hazardous wx	M1FC and facility made graphic wx		Text and graphics	Provides hazardous wx ·for broadcast
Obtain SIGMET	Issue hazardous wx	M1FC and facility made graphic wx		Text and graphics	Provides hazardous wx for broadcast
Obtain AIRMET	Issue hazardous wx	M1FC and facility made graphic wx		Text and graphics	Provides hazardous wx for broadcast
Obtain Center Wx Advisory	Issue hazardous wx	M1FC and facility made graphic wx		Text and graphics	Provides hazardous wx for broadcast
Obtain Severe Wx Watch	Issue hazardous wx	M1FC and facility made graphic wx		Text and graphics	Provides hazardous wx for broadcast

7.2.1 Obtain Weather Information (Continued)

Task Elements	Purpose	Information Source	User Interpretation	Information Format	Utility
Obtain TWEB route forecast	Issue hazardous wx	M1FC and vendor graphic wx		Text and graphics	Provide route wx for broadcast
Obtain winds aloft	Issue hazardous wx	M1FC and vendor graphic wx	No interpolation performed	Text and graphics	Provide winds at 3000-18000 ft.
Obtain radar reports	Issue hazardous wx	M1FC		Text	Provide precip. For broadcast area
Obtain surface wx reports	Issue hazardous wx	MIFC		Text	Provides surface obs for broadcast area
Obtain PIREPs	Issue hazardous wx	MIFC	Used to confirm wx information	Text	Used to alert pilots of conditions
Obtain density altitude	Issue wx info	Text table from book		Text/ Numerical	Conditional info given wx

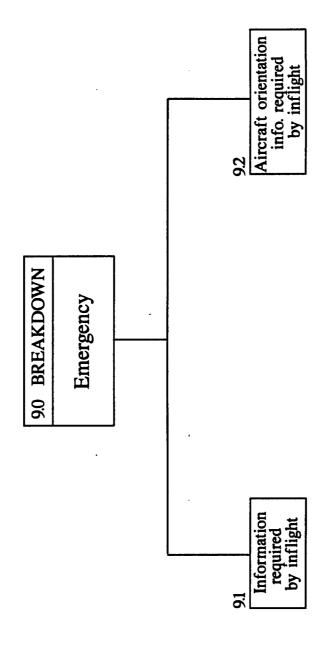

E-29

8.1.1/8.2.1 Obtain Weather Information

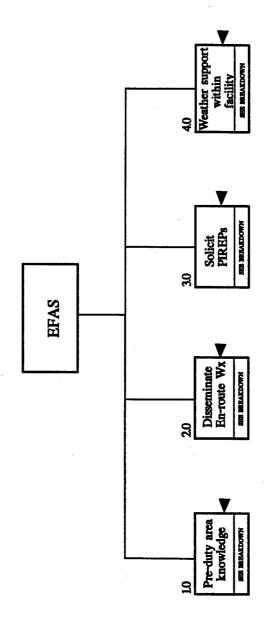

Task Elements	Purpose	Information Source	User Interpretation	Information Format	υτίλιτγ
Obtain wind direction and speed	Provide pilot with airport weather	Direct read (instrument)		text	provide info for current traffic flow
Determine favored runway	Provide pilot with airport info	Direct read from wind instrument		text	provide info for current traffic flow
Determine altimeter setting	Provide pilot with info	Direct read (instrument) MIFC		text	provide info for current traffic flow
Obtain weather	Provide pilot with airport weather	M1FC	use terminal forecast to obtain wx	text	provide info for current traffic flow
Obtain ceiling and visibility	Provide pilot with airport weather	MIFC	use SA to obtain ceiling and visibility	text	provide info for current traffic flow
Obtain RVR/RVV	Provide pilot with runway visibility	Direct read (instrument)		text	issued to IFR traffic for approach mins

8.1.1/8.2.1 Obtain Weather Information

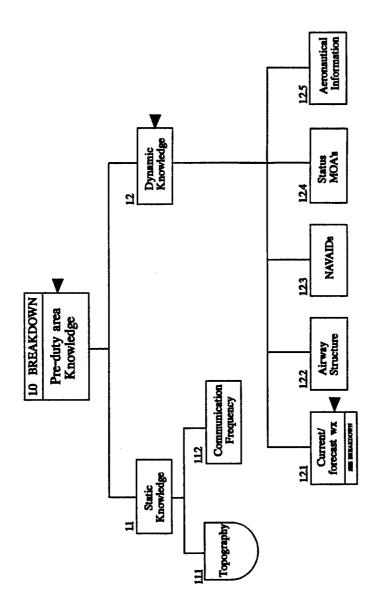

Task Elements	Purpose	Information Source	User Interpretation	Information Format	υτίλτη
obtain hazardous weather	provide pilot with weather info	MIFC		Text	Issue new hazardous wx
obtain wake turbulence	provide pilot with runway turbulence	Info based on type of arcft on rnwy prior		Verbal	Issue if wake turbc is a factor

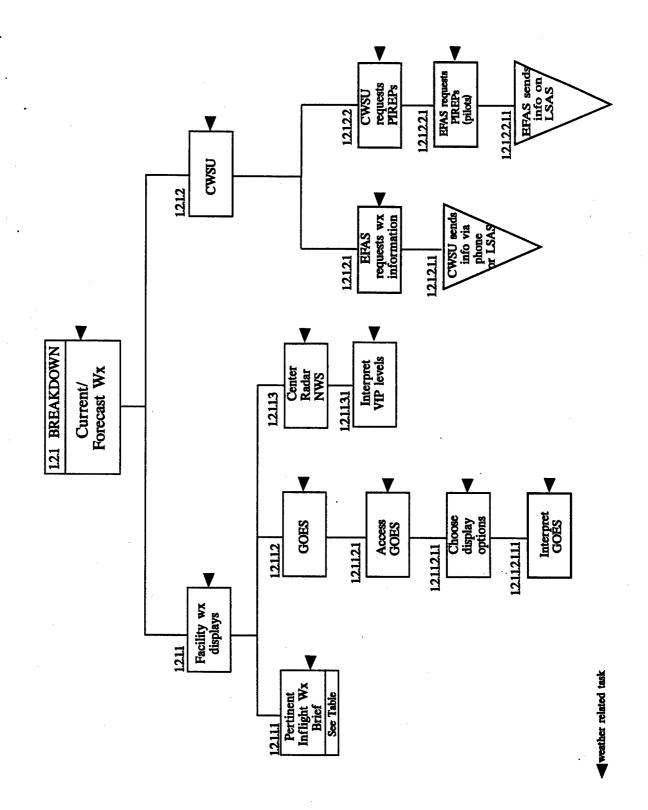

Appendix F EFAS Specialists JTA

Appendix H Job Task Definitions

Inflight Specialist

Pre-duty Briefing - Before assuming pilot briefing duties, the specialist familiarizes himself with aeronautical and weather conditions to effectively provide briefing service.

Interphone Communication - Communication between a specialist within AFSS and another ATCF remote from the AFSS.

Radio Aircraft Contacts - Contact made between the flight service specialist and an aircraft on a radio frequency.

Monitoring - To check periodically, keep track of, or scrutinize the status of an item of equipment (ie., monitoring the status of a questionable NAVAID).

Strip Marking - Standard hand-printed characters to prevent misinterpretation of data printed on flight progress strips.

Broadcast Duty - A scheduled or unscheduled broadcast of weather and other flight information.

Local Airport Advisories - A service provided by flight service stations at airports not serviced by an operating control tower. A Local Airport Advisory provides the following information to an arriving or departing aircraft:

- 1. wind direction and speed,
- 2. favored runway,
- 3. altimeter setting,
- 4. pertinent known traffic,
- 5. pertinent known field conditions,
- 6. airport taxi routes and traffic patterns, and
- 7. authorized instrument approach procedures.

Emergency - A distress or an urgency condition.

Standard Weather Briefing - Using all sources of weather and aeronautical information, the specialist provides the following data for a pilot briefing:

- 1. adverse conditions,
- 2. synopsis,
- 3. current conditions,
- 4. enroute forecast,
- 5. destination forecast,
- 6. winds aloft,
- 7. notices to airmen (NOTAM),
- 8. ATC delays, and
- 9. any other aeronautical data requested.

Abbreviated Weather Briefing - The specialist provides an abbreviated briefing when a pilot requests information to supplement mass disseminated data, update a previous briefing, or when the pilot requests that the briefing be limited to specific information.

Outlook Weather Briefing - The specialist provides an outlook briefing when the proposed departure is 6 or more hours from the time of the briefing. The briefing is limited to forecast data as applicable to the proposed flight.

EFAS

Pre-duty Area of Knowledge - The flight watch specialist is responsible for an in-depth comprehensive knowledge of static and dynamic factors within an approximate 600 nautical mile radius of the assigned facility.

Disseminate Enroute Weather - The specialist provides enroute aircraft with timely and pertinent weather data tailored to a specific altitude and route using the most current available sources of aviation meteorological information.

Solicit PIREPs - Solicit PIREPs for the affected area(s) when one or more of the following weather conditions exists, are reported, or are forecasted to occur:

- ceiling at or below 5,000 feet;
- visibility reported on the surface or aloft is 5 miles or less;
- 3. thunderstorms and related phenomenon;
- 4. turbulence of moderate degree or greater;
- icing of light degree or greater;
- 6. wind shear;
- 7. an NWS or an ATC facility indicates a need because of a specific weather or flight assistance situation;
- 8. necessary to determine flying condition pertinent to natural hazards (mountain passes, ridges, peaks) between the weather reporting stations;
- 9. the station is designated as responsible for PIREPs in an offshore coastal area; and
- 10. flight watch specialists shall solicit sufficient PIREPs to remain aware of flight condition.

Static Knowledge - Static knowledge factors include:

- 1. topography, and
- 2. communications frequencies.

Dynamic Knowledge - Dynamic knowledge factors frequently interrelate so that change in one causes others to change. These factors include:

- 1. current and forecast weather,
- 2. airway structure,
- navigational aids,
- 4. special military operations areas, and
- aeronautical information.

Topography - The accurate and detailed description of terrain factors within an approximate 600 nautical mile radius of the assigned facility, an area of over 1 million square miles.

Airway Structure - A control area or portion established in the form of a corridor the centerline of which is defined by radio navigational aids.

Aeronautical Information - Aeronautical information generally refers to NOTAMs, but may consist of any of the following:

- information concerning the establishment, condition, or change in any component of the NAS (ie., airports, NAVAIDs),
- 2. information regarding the boundaries and effective times of restricted or special use airspace,
- information regarding preferred or fuel efficient routes, and
- 4. traffic management information.

Disorientated Aircraft - Aircraft that is either unsure of his or her position or is lost.

DF Approach - A Direction Finder approach is used under emergency conditions were other instrument approach procedures cannot be executed. DF guidance for an instrument approach is given by ATC facilities with DF capability.

Preflight

Pre-duty Briefing - Before assuming pilot briefing duties, the specialist familiarizes himself with aeronautical and weather conditions to effectively provide briefing service.

Standard Weather Briefing - Using all sources of weather and aeronautical information, the specialist provides the following data for pilot weather briefings:

- 1. adverse conditions,
- 2. synopsis,
- 3. current conditions,
- 4. enroute forecast,
- 5. destination forecast,
- 6. winds aloft,
- 7. notices to airmen (NOTAM),
- 8. ATC delays, and
- 9. any other aeronautical data requested.

Abbreviated Weather Briefing - The specialist provides an abbreviated briefing when a pilot requests information to supplement mass disseminated data, update a previous briefing, or when the pilot requests that the briefing be limited to specific information.

Outlook Weather Briefing - The specialist provides an outlook briefing when the proposed departure is 6 or more hours from the time of the briefing. The briefing is limited to forecast data as applicable to the proposed flight.

TMU.

Traffic Programs and Procedures - Programs and procedures that develop and initiate flow control procedures as required between intracenter areas and between adjacent enroute facilities to regulate the flow of aircraft to the maximum number of aircraft that can be expeditiously and safely handled by the system.

Balance Air Traffic Flows - Controllers maintain a continuous awareness of the traffic flow, status of NAVAID's, weather conditions, and traffic forecast to preclude situations which would cause sector saturation, excessive enroute and terminal

Appendix I Weather Product Definitions Surface Observation (SAO) - Report of current surface weather at an observation point at an airport. It may be made up of manually observed and entered weather, automatically sensed weather, or a combination of both. This information is contained in a surface aviation weather report/SAO.

Terminal Forecast (FT) - A terminal forecast (FT) is a description of the surface weather expected to occur at an airport. It forecasts cloud heights and amounts, visibility, weather and wind relate to flight operations within 5 nautical miles of the center of the runway complex.

Area Forecast (FA) - An area forecast (FA) is a forecast of general weather conditions over an area encompassing several states. It is used to determine forecast enroute weather and to interpolate conditions at airports which do not have Fts issued.

Winds and Temperature Aloft (FD) - Winds and temperature aloft (FD) are 6, 12, and 24-hour forecast of wind direction (nearest 10° true north) and speed (knots) for selected flight levels. Forecast temperatures aloft (0° centigrade) are included for all but the 3000-foot level.

Significant Meteorological Information (SIGMET) - A weather advisory issued concerning weather significant to the safety of all aircraft. SIGMET advisories cover severe and extreme turbulence, severe icing and widespread dust or sand storms that reduce visibility to less than 3 miles.

Airman's Meteorological Information (AIRMET) - In flight weather advisories issued only to amend the area forecast concerning weather phenomena which are of operational interest to all aircraft and potentially hazardous to aircraft having limited capability because of lack of equipment, instrumentation, or pilot qualifications

Convective SIGMET (WST) - A weather advisory concerning convective weather significant to the safety of all aircraft. Convective SIGMET's are issued for tornados, lines of thunderstorms, embedded thunderstorms of any intensity level, areas of thunderstorms greater than or equal to VIP

level 4 with an areal coverage of 4/10 (40 percent) or more, and hail 3/4 inch or greater.

Center Weather Advisory (CWA) - A Center Weather Advisory (CWA) is an unscheduled inflight flow control, air traffic, and air crew advisory for use in anticipating and avoiding adverse weather conditions in the enroute and terminal areas.

Severe Weather Watch Bulletin (WW) - A severe weather watch bulletin (WW) defines areas of possible severe thunderstorms or tornado activity.

Satellite Data - A visible and infrared earth-sensing satellite used for weather observation.

Low Level Significant Prognostic Chart (12-24 hour forecast) - Significant weather prognostic charts, called "progs" for brevity, portray forecast weather which may influence flight planning. Some of forecasted weather are turbulence, icing, rain, snow, thunderstorm, freezing rain, tropical storm, and hurricane.

Composite Moisture Stability Chart (upper air) - The Composite Moisture Stability Chart is an analysis chart using observed upper air data. It is composed of the following four panels: stability, freezing level, precipitable water, and average relative humidity.

Tropopause Data Chart - A four-panel chart containing observed tropopause data, a maximum wind prog, a vertical wind shear prog, and a high level significant weather prog is prepared for the contiguous 48 states.

Weather Depiction Chart - The weather depiction chart is computer prepared from surface aviation (SAO) reports to give a broad overview of observed flying category conditions (e.g., VFR/IFR) as of the valid time of the chart.

Pilot Weather Reports (PIREP) - A report of meteorological phenomena encountered by aircraft in flight and issued by pilots.

Adverse Conditions - Significant meteorological and aeronautical information that might influence the pilot to alter the proposed flight.
